# Properties and units in the clinical laboratory sciences. Part X. Properties and units in general clinical chemistry (Technical Report)

*Abstract:* A coding scheme has been prepared for general clinical chemistry.

## PREFACE

The present document is part ten (X) of a series on properties and units in the clinical laboratory sciences initiated in 1987.

The series will comprise:

I. Syntax and semantic rules [1]
II. Kinds-of-property [2]
III. Elements (of properties) and their code values [3]
IV. Properties and their code values [4]
V. Properties and units in thrombosis and haemostasis [5]
VI. Properties and units in IOC-prohibited drugs [6]
VII. Properties and units in inborn errors of metabolism
VIII. Properties and units in clinical microbiology [7]
IX. Properties and units in trace elements [8]
X. *Properties and units in general clinical chemistry (this report)*
XI. Coding systems: structure and guidelines [9]
XII. Properties and units in clinical pharmacology and toxicology [10]
XIII. Properties and units in reproduction and fertility [11]
XVI. Properties and units in clinical allergology [12]

The size and complexity of Parts III and IV are such that their lists will be presented in electronic format. This is for ease of handling and to facilitate expression of concepts in different languages.

At the end, systematic terms, elaborated according to international standards and recommendations, should be available in the different domains of clinical laboratory sciences. The core of the series is code value strings representing concepts, that in combination delineate and define each type of property regardless of linguistic expression, thus avoiding errors during translation between languages.

## FOREWORD AND SCOPE

Clinical laboratory sciences are characterized by the exacting nature of the work performed and the demand for an accurate presentation of the outcome. Furthermore, the domain is transnational, international or "global".

The adherent informatics system, therefore, needs to identify the findings accurately and to present them with the degree of detail required. At the same time, it has to facilitate the transfer over linguistic and cultural barriers without distortion or loss of clarity, in order to promote clear, unambiguous, meaningful, and fully informative communication in different terminologies.

The degree to which a message (such as a laboratory report) needs to be expressed in a formal, systematic language depends on the geographical, linguistic, social, or professional distance between the communicating parties. The greater the distance, the greater the risk of misunderstanding.

Within one laboratory, local jargon terms may be used which are usually well understood between colleagues, but which would not be sufficiently widely known for communication with the outside world. Likewise, a laboratory and its local community of users, such as hospital or community physicians, may use a "local dialect" of the language of laboratory medicine which is well understood by all concerned; but when the communication possibilities are wider, even transnational, risks of serious misunderstanding arise.

The purpose of this document is to apply the IFCC–IUPAC recommended syntax structures for request and report and to create a systematic terminology that can be used as the basis for encoding laboratory messages in the domain of general clinical chemistry. This is to facilitate communication of messages about such properties through computing and telecommunication between databases, messages that contain sufficient information to allow translation from and to the required "local dialect" at each end.

Each entry in the list is formed following the rules given in [1] and in [9].

The systematic names recommended here are primarily for the purpose of unambiguous data exchange. Their use in routine language by clinicians or laboratory practitioners is optional but encouraged.

## ELEMENTS OF AN ENTRY

The terms recommended are given in bold, e.g., the systematic term for the type of property, the unit, and the code value.

**1 Name of system and parenthetic specification spelled out in full, and followed by a long dash (em dash).**
**2 Alphanumeric chemical prefixes to component name.**
**3 Recommended name of component and parenthetic specification. Shifted to the left for alphabetical sorting and searching, and followed by a semicolon.**
**4 Kind-of-property and parenthetic specification.**
**5 Unit.**
6 Presently recommended calibrator.
7 Previous calibrators.
8 Other term(s).
9 Authority: Code value for the international organization recommending the name of the component or the combined elements of an entry.
10 Note(s) with any further information.
**11 [NPUXXXXX]**
**Coding scheme identifier and code value, intended for interlaboratory transmission between databases.**
12 Example in abbreviated form.

The term "arbitrary", in principle, cannot be related to a volume. In clinical chemistry, however, a less well-defined "inhouse" or regional calibrator is often referred to and is expressed in "arbitrary unit per liter" in order to enable comparison of patient data over time and regionally. In each of these instances, further information should be given in the parenthesis "procedure". This could be information on the calibrator used, e.g., "BCR/CRM148/149R", or it could refer to the in-laboratory document "procedure xx" that is available on request.

In the examples given, a question mark, "?", has been used to represent the value of a result for properties including quantities.
